

## eICS™ Release Notes

These notes describe highlights of the eICS Web 4.1 and Mobile 1.7.0 releases that are scheduled for Wednesday, December 5, 2018. More information about these features and enhancements is available in your solution, through Help, or by contacting Juvare Support at 877-771-0911 or [support@juvare.com](mailto:support@juvare.com).

### Introduced New Hazard Vulnerability Analysis Features

Hazard Vulnerability Analysis (HVA) functionality has been improved with new features that streamline the process of creating and completing HVAs to help you more effectively assess potential risks. Use these new features to:

- Prepopulate hazard evaluations with data from the most recently finalized HVA. To save time, you do not need to re-enter the analysis details for each hazard. eICS records this information and allows you to simply review and update as needed.
- Enable the creation of multiple drafts within the same year, allowing you to quickly begin a new assessment without finalizing a previous version. In the event information changes after starting the initial draft, you can now easily start a new assessment.
- Allow administrators to manually complete assessments for a coalition once a facility has been designated to manage incidents on the coalition level. This feature is only available for organizations that use the Coordinated Response premium add-on.

### Introduced Coordinated Response Premium Add-On for Mobile

Coordinated Response is an innovative add-on that allows you to share information with incident command at the health system, facility group, coalition, state or regional level. Associated facilities can also submit resource requests to better locate critical resources during an incident. The features of this add-on are now available through the mobile app.

### Updated Mobile Features

Feature enhancements include updated navigation, faster image uploading, and other minor fixes that improve your experience.
