

EMResource™ 3.53 Release Notes

These notes describe highlights of the EMResource 3.53 release scheduled for Wednesday, November 4, 2020. More information is available through your solution or by contacting the Juvare Support Center at 877-771-0911 or support@juvare.com.

Calculated Status Types

Added the ability to create new status types, which are defined by an equation that uses existing numeric status types as variables. The status type value is recalculated when any of the component status types is updated to a new value. For example, when utilizing a calculated status type, you can display a value for “Total ICU Beds” by combining the values entered for “Adult ICU Beds”, “PICU Beds”, and “NICU Beds.”

Default Status Values

Administrators can indicate a default value for a status type, which then becomes the initial status value for each resource until subsequently updated for the resource. For example, you can indicate a default value of “Normal” for “Power Status.”

Status Reasons in APIs

Status reasons can now be included in both inbound and outbound web services APIs. This new feature greatly enhances integration options and improves the way in which HHS and CDC COVID-19 reporting are conducted.

Enhancements

Introduced several system improvements and security updates.
